CLAIMS

A communication terminal apparatus that is connected to a communicatee through a communication line and transmits/receives information to/from said communicatee, characterized by comprising:

communication controlling means that executes controls required for the transmission/reception of information through said communication line;

read-out means to read out information recorded on a seal-like recording medium pasted anywhere at discretion; and

connecting means that connects a communication line to the communicatee corresponding to the information read out by said read-out means.

- 2. The communication terminal apparatus according to Claim 1, characterized in that said seal-like recording medium has adhesives applied to the back surface to allow for pasting anywhere at discretion and information displayed on the front surface to indicate recorded contents.
- 3. The communication terminal apparatus according to Claim 2, characterized in that information recorded on said seal-like recording medium corresponds to operators of said communication terminal apparatus.

4. The communication terminal apparatus according to Claim 2, characterized in that information required for the connection to said communicatee is recorded on said seal-like recording medium, and on the front surface of said seal-like recording medium an image indicating said communicatee is displayed.

- 5. The communication terminal apparatus according to Claim 4, characterized in that attribute information related to said communicatee is further recorded on said seal-like recording medium, and said connecting means executes a process for the connection to said communicatee according to said attribute information.
- 6. The communication terminal apparatus according to Claim 5, characterized in that said attribute information represents periods or time periods during which a connection to said communicatee is possible, or periods or time periods during which a connection to said communicatee is impossible; and

said connecting means executes said process for connecting the communication line to the communicatee only if present date and time is within the period or time period permitted by said attribute information.

7. The communication terminal apparatus according to Claim 5, characterized in that said attribute information represents information about positions from where said communicatee is accessible,

or information about positions from where said communicatee is inaccessible; and

said connecting means executes said process for connecting the communication line to the communicatee only if present position is a position permitted by said attribute information.

- 8. The communication terminal apparatus according to Claim 1, characterized by further comprising presentation means that presents information read out by said read-out means.
- 9. The communication terminal apparatus according to Claim 8, characterized in that presentation control information is further recorded on said seal-like recording medium to indicate whether the read out information is presented or not, and said presentation means determines whether the information is presented or not according to said presentation control information.
- 10. The communication terminal apparatus according to Claim 1, characterized by further comprising writing means that writes predetermined information on said seal-like recording medium.
- 11. The communication terminal apparatus according to Claim 10, characterized in that an accessible count to a communicatee is further recorded on said seal-like recording medium, and only if said accessible count read out by said read-out means is not "0," a communication line

is connected to said communicatee by said connecting means as well as its value is decremented by "1" and then written to said seal-like recording medium by said writing means.

- 12. The communication terminal apparatus according to Claim 1, characterized in that a semiconductor memory is built in said seal-like recording medium and the recorded contents of said semiconductor memory are read and written without any contact.
- 13. A seal-like recording medium providing information used to access a desired communicatee to a communication terminal apparatus that is connected to a communicatee through a communication line and transmits/receives information to/from said communicatee, characterized in that:

adhesives are applied to the back surface to allow for pasting anywhere at discretion;

an image indicating a communicatee is displayed on the front surface; and

information required for the connection to a communicatee is recorded.

14. The seal-like recording medium according to Claim 13, characterized in that attribute information related to communicatees is further recorded.
